**Abstract**—The aim of this paper is to introduce the class of  $\delta sg^*$ -closed sets and obtain the characterizations of  $T_{1/2}$  space, partition space, semi-weakly Hausdorff space,  $R_1$  space and Hausdorff space via  $\delta sg^*$ -closed sets.

**Keywords**—  $\delta sg^*$ -closed set,  $\delta gs$ -closed set,  $g\delta s$ -closed set,  $gs$ -closed set.

## I. INTRODUCTION

In 1963, Levine introduced and studied the concepts of semi-open sets in topological spaces as a weaker form of open sets [12]. The study of generalized closed sets was initiated by Levine in order to extend the topological properties of closed sets to a larger family of sets in 1970 [11]. Dontchev et.al. [4], Sudha et.al. [16] and Meena et.al. [13] introduced various  $g$ -closed sets using  $\delta$ -closed sets. In 2007, J.H.Park et.al. introduced and studied two concepts namely  $g\delta s$ -closed and  $\delta gs$ -closed sets using  $\delta$ -semi closure and proved that the class of  $\delta gs$ -closed sets is weaker than the class of  $g\delta s$ -closed sets [8, 9]. In this paper, we introduce and study the class of  $\delta sg^*$ -closed sets, which is weaker than the class of  $\delta$ -semi closed sets and is stronger than the classes of  $g\delta s$ -closed sets and  $\delta gs$ -closed sets. The spaces in which the concepts of  $g$ -closed and closed sets coincide are called  $T_{1/2}$ -spaces [12].  $T_{1/2}$ -spaces are precisely the spaces in which singleton are open or closed.  $T_b$  and  $T_d$  spaces are introduced by Devi et.al., [3] and Semi- $T_{1/2}$ -spaces by Bhattacharya et.al., [2]. We use  $\delta sg^*$ -closed sets to obtain new characterization of semi-weakly Hausdorff spaces which are the spaces with semi- $T_{1/2}$ -semi regularization [8].

## II. PRELIMINARIES

We list some definitions in a topological space  $(X, \tau)$  which are useful in the following sections. The interior ( $\delta$ -interior) and the closure ( $\delta$ -closure) of a subset  $A$  of  $(X, \tau)$  are denoted by  $\text{int}(A)$  ( $\delta\text{-int}(A)$ ) and  $\text{cl}(A)$  ( $\delta\text{-cl}(A)$ ) respectively. Throughout the present paper  $(X, \tau)$  represents non-empty topological space on which no separation axiom is defined, unless otherwise mentioned.

**Definition 2.1** A subset  $A$  of  $(X, \tau)$  is called a

- 1) a semi open set [12] if  $A \subseteq \text{cl}(\text{int}(A))$
- 2) a  $\delta$ -open set [17] if it is a union of regular open sets
- 3) a  $\delta$ -semi open [10] if  $A \subseteq \text{cl}(\delta\text{-int}(A))$

The complement of a semi open (resp.  $\delta$ -open,  $\delta$ -semi open) set is called a semi closed (resp.  $\delta$ -closed,  $\delta$ -semi closed) set. The  $\delta$ -semi interior of a subset  $A$  of  $(X, \tau)$  is the union of all  $\delta$ -semi open sets contained in  $A$  and is denoted by  $\delta\text{-sint}(A)$

and the  $\delta$ -semi closure of a subset  $A$  of  $(X, \tau)$  is the intersection of all  $\delta$ -semi closed sets containing  $A$  and is denoted by  $\delta\text{-scl}(A)$ .

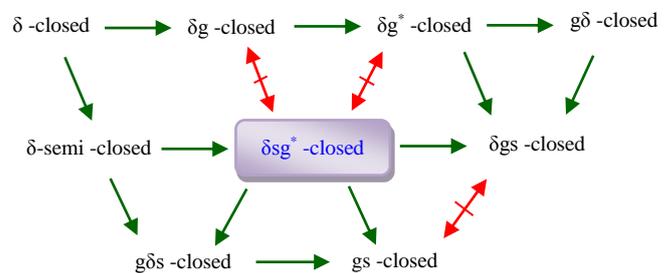

**Definition 2.2** A subset  $A$  of a space  $(X, \tau)$  is said to be

- (a) generalized closed (briefly  $g$ -closed) [11] if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ .
- (b) generalized semi-closed (briefly  $gs$ -closed) [1] if  $\text{scl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ .
- (c) generalized  $\delta$ -semi-closed (briefly  $g\delta s$ -closed) [8] if  $\delta\text{-scl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ .
- (d)  $\delta$ -generalized closed (briefly  $\delta g$ -closed) [4] if  $\delta\text{-cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ .
- (e) generalized  $\delta$ -closed (briefly  $g\delta$ -closed) [5] if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\delta$ -open in  $(X, \tau)$ .
- (f)  $\delta$ -generalized star -closed (briefly  $\delta g^*$ -closed) [5] if  $\delta\text{-cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\delta$ -open in  $(X, \tau)$ .
- (g)  $\delta$ -generalized semi-closed (briefly  $\delta gs$ -closed) [9] if  $\delta\text{-scl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\delta$ -open in  $(X, \tau)$ .

## III. $\delta sg^*$ -CLOSED SETS

**Definition 3.1** [6] A subset  $A$  of a topological space  $(X, \tau)$  is called  $\delta$  semi generalized star -closed (briefly  $\delta sg^*$ -closed) set if  $\delta\text{-scl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $g$ -open in  $X$ .

**Remark 3.2** For a subset of a topological space, from definitions stated above, we have the following diagram of implications:

where none of these implications is reversible as shown by examples in [3,4,9] and the following examples.

**Example 3.3** [9] Let  $X = \{a, b, c, d\}$  and  $\tau = \{X, \phi, \{a\}, \{c\}, \{a,b\}, \{a,c\}, \{a,b,c\}, \{a,c,d\}\}$ . Then

- a) Set  $A = \{a,c,d\}$ . Then  $A$  is  $\delta gs$ -closed but neither  $gs$ -closed nor  $g\delta s$ -closed in  $(X, \tau)$ .
- b) Set  $B = \{b,c\}$ . Then  $B$  is  $gs$ -closed but not  $\delta gs$ -closed in  $(X, \tau)$ .
- c) Set  $C = \{c\}$ . Then  $C$  is  $\delta$ -semi closed (hence  $\delta gs$ -closed) but not  $\delta g^*$ -closed in  $(X, \tau)$ .

**Example 3.4** Let  $X = \{a, b, c, d\}$  and  $\tau = \{X, \phi, \{a\}, \{c\}, \{a,b\}, \{a,c\}, \{a,b,c\}, \{a,c,d\}\}$ .

- 1) Set  $A = \{b\}$ . Then  $A$  is  $g\delta s$ -closed and  $g\delta$ -closed but neither  $\delta g^*$ -closed nor  $\delta$ -semi closed in  $(X, \tau)$ .
- 2) Set  $B = \{c\}$ . Then  $B$  is  $\delta$ -semi closed (hence  $\delta g s$ ) but not  $g\delta$ -closed in  $(X, \tau)$ .

**Example 3.5** Let  $X = \{a, b, c, d\}$  and  $\tau = \{X, \phi, \{a\}, \{b\}, \{a,b\}, \{a,b,c\}\}$ . Set  $A = \{a,b,c\}$ . Then  $A$  is  $\delta g^*$ -closed but not  $g\delta s$ -closed in  $(X, \tau)$ , since  $A \in \tau$  but  $\delta\text{-scl}(A) = X \not\subseteq A$ .

**Example 3.6** Let  $X = \{a,b,c\}$ ,  $\tau = \{X, \phi, \{a\}\}$ . Then

- 1) Set  $A = \{b,c\}$ . Then  $A$  is  $\delta g s^*$ -closed but not  $\delta$ -semi closed.
- 2) Set  $B = \{a,b\}$ . Then  $B$  is  $g\delta s$ -closed but not  $\delta g s^*$ -closed.
- 3) Set  $C = \{a,c\}$ . Then  $C$  is  $g s$ -closed but not  $\delta g s^*$ -closed.
- 4) Let  $X = \{a,b,c\}$ ,  $\tau = \{X, \phi, \{a\}, \{a,b\}\}$ . Then the set  $\{b\}$  is  $g s$ -closed but not  $g\delta s$ -closed.
- 5) Let  $X = \{a,b,c\}$ ,  $\tau = \{X, \phi, \{a\}, \{b\}, \{a,b\}\}$ . Then the set  $\{a\}$  is  $g\delta s$ -closed but not  $\delta g^*$ -closed.

#### IV. CHARACTERIZATIONS VIA $\delta g s^*$ -CLOSED SETS

In this section many characterizations are derived via  $\delta g s^*$ -closed sets.

##### Results 4.1

- (1) In semi-regular spaces, the notions of  $g\delta s$ -closed and  $\delta g s$ -closed sets coincide [8, 9].
- (2) A space  $(X, \tau)$  is  $T_d$  [2] (resp.  $T_b$  [2]) if every  $g s$ -closed set is  $g$ -closed (resp. Closed).

**Definition 4.2** A space with semi- $T_{1/2}$  semi-regularization is called *semi weakly Hausdorff* [8].

Now, we observe that in semi-regular  $T_{1/2}$ -spaces the notions of  $\delta g s^*$ -closed and  $g s$ -closed sets coincide.

**Theorem 4.3** Let  $A$  be a subset of a  $T_{1/2}$ -space  $(X, \tau)$  then:

- (a)  $A$  is  $\delta g s^*$ -closed if and only if  $A$  is  $g\delta s$ -closed
- (b) If  $(X, \tau)$  is semi regular then  $A$  is  $\delta g s^*$ -closed if and only if  $A$  is  $g s$ -closed.
- (c) If in addition,  $(X, \tau)$  is  $T_b$  (resp.  $T_d$ )  $A$  is  $\delta g s^*$ -closed if and only if  $A$  is closed (resp.  $g$ -closed).

**Proof:** (a) Let  $(X, \tau)$  be  $T_{1/2}$ . Then  $g$ -open sets coincide with open sets which leads to (a).

(b) In a semi regular space  $g\delta s$ -closed sets coincide with  $g s$ -closed sets [Theorem 2.8 of [8]] Then (a) implies (b).

(c) The proof follows from Theorem 2.8 of [8] and from (a).

**Definition 4.4** A *partition space* is a space where every open set is closed.

**Remark 4.5** In a partition space open sets coincide with  $\delta$ -open sets and the concepts of  $\delta$ -closure and  $\delta$ -semi closure coincide for any set.

**Theorem 4.6** For a subset  $A$  of a  $T_{1/2}$  partition space  $(X, \tau)$  the following are equivalent:

- (a)  $A$  is  $\delta g s^*$ -closed
- (b)  $A$  is  $\delta g$ -closed
- (c)  $A$  is  $\delta g^*$ -closed
- (d)  $A$  is  $g\delta s$ -closed
- (e)  $A$  is  $\delta g s$ -closed

**Proof:** (b)  $\Leftrightarrow$  (c)  $\Leftrightarrow$  (d)  $\Leftrightarrow$  (e) is proved in [Theorem 2.6 of [8]]

(a)  $\Leftrightarrow$  (b) In a  $T_{1/2}$ -space,  $g$ -open sets coincide with open sets and hence by Remark 4.5 the proof follows.

The previous observation leads to the problem of finding the spaces  $(X, \tau)$  in which the  $g s$ -closed sets of  $(X, \tau_s)$  are  $\delta g s^*$ -closed in  $(X, \tau)$ . While we have not been able to completely resolve this problem, we offer partial solutions. For that reason the spaces with semi- $T_{1/2}$  semi-regularization is called *semi-weakly Hausdorff*. Recall that a space is called *almost weakly Hausdorff* [4] if its semi-regularization is  $T_{1/2}$ . Clearly almost weakly Hausdorff spaces are semi-weakly Hausdorff, but not conversely.

**Example 4.7** [8] Let  $X = \{a, b, c, d\}$  with  $\tau = \{X, \phi, \{a\}, \{b\}, \{a,b\}\}$ . Then  $(X, \tau)$  is clearly semi-weakly Hausdorff but not almost weakly Hausdorff.

**Theorem 4.8** For a subset  $A$  of a *semi weakly Hausdorff space*  $(X, \tau)$  the following are equivalent:

- (a)  $A$  is  $g s$ -closed in  $(X, \tau_s)$
- (b)  $A$  is  $\delta$ -semi closed in  $(X, \tau)$
- (c)  $A$  is  $\delta g s^*$ -closed in  $(X, \tau)$ .

**Proof:** (a)  $\Rightarrow$  (b) Let  $A \subseteq X$  be a  $g s$ -closed subset of  $(X, \tau_s)$ . Let  $x \in \delta\text{-scl}(A)$ . If  $\{x\}$  is  $\delta$ -semi open, then  $x \in A$ . If not then  $X \setminus \{x\}$  is  $\delta$ -semi open, since  $X$  is semi weakly Hausdorff. Assume that  $x \notin A$ . Since  $A$  is  $g s$ -closed in  $(X, \tau_s)$ , then  $\delta\text{-scl}(A) \subseteq X \setminus \{x\}$ , that is  $x \notin \delta\text{-scl}(A)$ . By contradiction  $x \in A$ . Thus  $\delta\text{-scl}(A) = A$  or equivalently  $A$  is  $\delta$ -semi closed.

(b)  $\Rightarrow$  (c) The proof follows from the definition of  $\delta g s^*$ -closed sets.

(c)  $\Rightarrow$  (a) Let  $A \subseteq U$ , where  $U$  is open in  $(X, \tau_s)$ . Then  $U$  is  $\delta$ -open in  $(X, \tau)$ . Every  $\delta$ -open set is  $g$ -open. Since  $A$  is  $\delta g s^*$ -closed in  $(X, \tau)$ ,  $\delta\text{-scl}(A) \subseteq U$ . Hence by Lemma 7.3 of [14],  $\text{scl}(A) \subseteq U$  in  $(X, \tau_s)$ . Thus  $A$  is  $g s$ -closed in  $(X, \tau_s)$ .

**Theorem 4.9** For a space  $(X, \tau)$  the following are equivalent:

- (a) Every  $g$ -open set of  $X$  is a  $\delta$ -semi closed set
- (b) Every subset of  $X$  is a  $\delta g s^*$ -closed set.

**Proof:** (a)  $\Rightarrow$  (b) Let  $A \subseteq U$ , where  $U$  is  $g$ -open and  $A$  is an arbitrary subset of  $X$ . By (a),  $U$  is  $\delta$ -semi closed and thus  $\delta\text{-scl}(U) \subseteq U$ . Thus  $\delta\text{-scl}(A) \subseteq \delta\text{-scl}(U) \subseteq U$ . Hence  $A$  is  $\delta g s^*$ -closed.

(b)  $\Rightarrow$  (a) Let  $U$  be a  $g$ -open set of  $(X, \tau)$ , then by (b)  $\delta\text{-scl}(U) \subseteq U$  or equivalently  $U$  is  $\delta$ -semi closed.

##### Remark 4.10

- (a) Every finite union of  $\delta g s^*$ -closed sets may fail to be a  $\delta g s^*$ -closed set.
- (b) Every finite intersection of  $\delta g s^*$ -closed sets may fail to be a  $\delta g s^*$ -closed set.

The following examples support the above remark.

**Example 4.11** Let  $X = \{a,b,c\}$ ,  $\tau = \{X, \phi, \{a\}, \{b\}, \{a,b\}\}$ . Consider  $A = \{a\}$  and  $B = \{b\}$  then  $A$  and  $B$  are  $\delta g s^*$ -closed sets but  $A \cup B = \{a,b\}$  is not a  $\delta g s^*$ -closed set in  $(X, \tau)$ .

**Example 4.12** Let  $X = \{a, b, c, d\}$ ,  $\tau = \{X, \phi, \{c\}, \{a,b\}, \{a,b,c\}\}$ . Consider  $A = \{a,b\}$  and  $B = \{a,d\}$  then  $A$  and  $B$  are  $\delta g s^*$ -closed sets but  $A \cap B = \{a\}$  is not a  $\delta g s^*$ -closed set in  $(X, \tau)$ .

**Definition 4.13** A topological space  $(X, \tau)$  is called an  $R_1$ -space if every two different points with distinct closures have disjoint neighborhoods.

**Theorem 4.14** For a compact subset  $A$  of an  $R_1$ -topological space  $(X, \tau)$  the following conditions are equivalent, when  $(X, \tau)$  is also  $T_{1/2}$ .

- (a)  $A$  is a  $\delta\text{sg}^*$ -closed set
- (b)  $A$  is a  $\text{gs}$ -closed set

**Proof:**

(a)  $\Rightarrow$  (b) is clear.

(b)  $\Rightarrow$  (a) Let  $A \subseteq U$ , where  $U$  is  $\text{g}$ -open in  $(X, \tau)$ . In a  $T_{1/2}$ -space,  $\text{g}$ -open sets coincide with open sets. In  $R_1$ -spaces the concepts of closure and  $\delta$ -closure coincide for compact sets [Theorem 3.6 in [7]]. Thus the rest of the proof follows from the definition of  $\delta\text{sg}^*$ -closed sets.

**Corollary 4.15** In Hausdorff spaces, a finite set is  $\text{gs}$ -closed if and only if it is  $\delta\text{sg}^*$ -closed.

**Theorem 4.16** Let  $A$  be a subset of  $(X, \tau)$ . Then we have if  $A$  is  $\delta\text{sg}^*$ -closed in  $X$ , then  $\delta\text{-scl}(A) \setminus A$  does not contain any non empty closed set converse not true.

**Proof:** Let  $F$  be a closed set such that  $F \subseteq \delta\text{-scl}(A) \setminus A$ . Then  $A \subseteq X \setminus F$ . Since  $A$  is a  $\delta\text{sg}^*$ -closed set and  $X \setminus F$  is open and hence  $\text{g}$ -open,  $\delta\text{-scl}(A) \subseteq X \setminus F$ , that is  $F \subseteq X \setminus \delta\text{-scl}(A)$ . Hence  $F \subseteq \delta\text{-scl}(A) \cap (X \setminus \delta\text{-scl}(A)) = \phi$ . This shows that  $F = \phi$ .

For the converse part, the counter example is:

Let  $X = \{a,b,c\}$  and  $\tau = \{X, \phi, \{a\}\}$ . Let  $A = \{b\}$  then  $\delta\text{-scl}(A) \setminus A = X \setminus A = \{a,c\}$ . Therefore  $\delta\text{-scl}(A) \setminus A$  does not contain non-empty closed set  $\{b,c\}$ . But  $A$  is not  $\delta\text{sg}^*$ -closed.

**Theorem 4.17** If  $A$  is  $\delta\text{sg}^*$ -closed in  $(X, \tau)$  if and only if  $\delta\text{-scl}(A) \setminus A$  does not contain any non empty  $\text{g}$ -closed set in  $(X, \tau)$ .

**Proof: Necessity** - Suppose that  $A$  is  $\delta\text{sg}^*$ -closed, let  $F$  be any  $\text{g}$ -closed such that  $F \subseteq \delta\text{-scl}(A) \setminus A$ . Then  $A \subseteq X \setminus F$  and  $X \setminus F$  is  $\text{g}$ -open in  $(X, \tau)$ . Since  $A$  is  $\delta\text{sg}^*$ -closed set in  $(X, \tau)$ ,  $\delta\text{-scl}(A) \subseteq X \setminus F$ . Thus,  $F \subseteq X \setminus \delta\text{-scl}(A)$ . Therefore,  $F \subseteq (\delta\text{-scl}(A) \setminus A) \cap (X \setminus \delta\text{-scl}(A)) = \phi$ . Hence  $F = \phi$ .

**Sufficiency** - Suppose that  $A \subseteq U$  and  $U$  is any  $\text{g}$ -open set in  $(X, \tau)$ . If  $A$  is not a  $\delta\text{sg}^*$ -closed set, then  $\delta\text{-scl}(A) \subseteq U$  and hence  $\delta\text{-scl}(A) \cap (X \setminus U) \neq \phi$ . We have a non empty  $\text{g}$ -closed set  $\delta\text{-scl}(A) \cap (X \setminus U)$  such that  $\delta\text{-scl}(A) \cap (X \setminus U) \subseteq \delta\text{-scl}(A) \cap (X \setminus A) = \delta\text{-scl}(A) \setminus A$  which contradicts the hypothesis.

**Corollary 4.18** If  $A$  is a  $\delta\text{sg}^*$ -closed subset of  $(X, \tau)$ , then  $A$  is  $\delta$ -semi closed if and only if  $\delta\text{-scl}(A) \setminus A$  is  $\text{g}$ -closed.

**Theorem 4.19** Let  $A$  be a subset of  $(X, \tau)$ . Then we have if  $A$  is  $\delta\text{sg}^*$ -closed in  $X$  and  $A \subseteq B \subseteq \delta\text{-scl}(A)$ , then  $B$  is also a  $\delta\text{sg}^*$ -closed set.

**Proof:** Let  $U$  be a  $\text{g}$ -open set of  $X$  such that  $B \subseteq U$  then  $A \subseteq U$ . Since  $A$  is a  $\delta\text{sg}^*$ -closed set,  $\delta\text{-scl}(A) \subseteq U$ . Also since  $B \subseteq \delta\text{-scl}(A)$ ,  $\delta\text{-scl}(B) \subseteq \delta\text{-scl}(\delta\text{-scl}(A)) = \delta\text{-scl}(A)$ . Hence  $\delta\text{-scl}(B) \subseteq U$ . Therefore  $B$  is also a  $\delta\text{sg}^*$ -closed set.

**Theorem 4.20** If  $A$  is  $\text{g}$ -open and  $\delta\text{sg}^*$ -closed in  $(X, \tau)$ , then  $A$  is a  $\delta$ -semi closed set of  $X$ .

**Proof:** If  $A$  is  $\text{g}$ -open and  $\delta\text{sg}^*$ -closed. Let  $A \subseteq A$ , where  $A$  is  $\text{g}$ -open and  $\delta\text{-scl}(A) \subseteq A$  which implies  $\delta\text{-scl}(A) = A$ . Hence  $A$  is  $\delta$ -semi closed.

**Theorem 4.21** Let  $A \subseteq Y \subseteq X$ . Then

- (a) If  $Y$  is open in  $(X, \tau)$  and  $A$  is  $\delta\text{sg}^*$ -closed in  $X$ , then  $A$  is  $\delta\text{sg}^*$ -closed relative to  $Y$ .
- (b) If  $Y$  is  $\delta\text{sg}^*$ -closed and  $\text{g}$ -open in  $(X, \tau)$  and  $A$  is  $\delta\text{sg}^*$ -closed relative to  $Y$ , then  $A$  is  $\delta\text{sg}^*$ -closed in  $X$ .

**Proof: (a)** Let  $A \subseteq Y \cap G$ , where  $G$  is  $\text{g}$ -open. Since  $A$  is  $\delta\text{sg}^*$ -closed in  $(X, \tau)$ ,  $\delta\text{-scl}(A) \subseteq Y \cap G \subseteq G$ , which implies  $Y \cap \delta\text{-scl}(A) \subseteq Y \cap G$  which is  $\text{g}$ -open. Therefore  $Y \cap \delta\text{-scl}(A) \subseteq G$ . Then  $A$  is  $\delta\text{sg}^*$ -closed relative to  $Y$ , as  $Y \cap \delta\text{-scl}(A)$  is the  $\delta\text{-scl}(A)$  relative to  $Y$ . That is  $Y \cap \delta\text{-scl}(A) = \delta\text{-scl}_Y(A)$ .

**(b)** Let  $G$  be a  $\text{g}$ -open subset of  $(X, \tau)$  such that  $A \subseteq G$ . Then  $A \subseteq G \cap Y$ . Since  $A$  is  $\delta\text{sg}^*$ -closed relative to  $Y$ , then  $\delta\text{-scl}(A) \subseteq G \cap Y$ , i.e.  $\delta\text{-scl}(A) \cap Y \subseteq G \cap Y$  from Theorem 4.2.25 of [15] and Theorem 4.20,  $\delta\text{-scl}(A) = \delta\text{-scl}(A \cap Y) = \delta\text{-scl}(A) \cap \delta\text{-scl}(Y) = \delta\text{-scl}(A) \cap Y$ . Therefore  $\delta\text{-scl}(A) \subseteq G \cap Y \subseteq G$ . Hence  $A$  is  $\delta\text{sg}^*$ -closed in  $X$ .
